If you answered yes, you are right on. For example, if we plugged in a 1 for x , then y would only equal one value, $-1/2$. Note that ANY value you would plug in for x would produce only one value for y .. Note that since it is solved for y , y is our output value and x is our input value.

Section 2-9 : Continuity. Over the last few sections we've been using the term "nice enough" to define those functions that we could evaluate limits by just evaluating the function at the point in question.

where q is the measure of a certain angle in the triangle, and a and b are the lengths of two specific sides.. This means that If the former equation holds, we can choose any right triangle, then take the measurement of one of the non-right angles, and when we evaluate the trigonometric function at that angle, the result will be the ratio of the lengths of two of the triangle's sides.
