Property of Closure. If we take two real numbers and multiply them together, we get another real number. (The real numbers are all the rational numbers and all the irrational numbers.) Because this is always true, we say that the real numbers are "closed under the operation of multiplication": there is no way to escape the set. When you combine any two elements of the set, the result is also ...

In mathematics, a group is a set equipped with a binary operation which combines any two elements to form a third element in such a way that four conditions called group axioms are satisfied, namely closure, associativity, identity and invertibility.One of the most familiar examples of a group is the set of integers together with the addition operation, but groups are encountered in numerous ...

Definition. Informally, a field is a set, along with two operations defined on that set: an addition operation written as a + b, and a multiplication operation written as a · b, both of which behave similarly as they behave for rational numbers and real numbers, including the existence of an additive inverse −a for all elements a, and of a multiplicative inverse b −1 for every nonzero ...

Inner and outer Lexical Environment. Now let's go on and explore what happens when a function accesses an outer variable. During the call, say() uses the outer variable phrase, let's look at the details of what's going on. First, when a function runs, a new function Lexical Environment is created automatically.

Supremum. The supremum is the least upper bound of a set, defined as a quantity such that no member of the set exceeds , but if is any positive quantity, however small, there is a member that exceeds (Jeffreys and Jeffreys 1988). When it exists (which is not required by this definition, e.g., does not exist), it is denoted (or sometimes simply for short).
