Key Difference: Weather is the state or conditions of the atmosphere over a short period of time, usually a day or so. Climate is the average conditions that are expected at a certain place over a number of years. Weather and climate are words that are often heard in meteorology, while weather is also used in day to day in order to refer to the conditions outside.

Lyme disease is spread to humans through the bite of infected ticks. The tick population is affected by weather and climate. Many factors determine tick population densities as well as diseased population densities of ticks so that no single factor can determine likelihood of exposure to tick-borne disease. Overall climate and primary host population determine the localities where ticks will thrive.

One of the most visible consequences of a warming world is an increase in the intensity and frequency of extreme weather events. The National Climate Assessment finds that the number of heat waves, heavy downpours, and major hurricanes has increased in the United States, and the strength of these events has increased, too.. A measure of the economic impact of extreme weather is the increasing ...
